# User Needs and Digital Libraries Design

Darmstadt University of Technology

Working group *telos*

(**t**echnology for **e**lectronic **l**ibraries and  
the **o**rganization of the **s**emantic web)

Rudi Schmiede

# User Needs and Digital Libraries Design (1):

Information and Knowledge in the “Information  
Society”

Distributed Information Structures in Science

# Outline

- What are user needs?
- What does “information society” mean?
- Information and/vs. knowledge
- What is new in the digital era?
- Distributed digital information structures
- Strategic issues in DL design

## User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

# The social frame

- User needs are not fixed entities, not simply to be questionaired
- Formed by work situation and environment
- Dependent on possibilities of access
- Change according to “communities of practice”

## User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

# Distributed concepts

- Make possible to access manifold resources and services
- Local interface must be simple and powerful
- Today's universal access tool: The Web browser
- "Global information at your fingertips"

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Virtual Integration of resources and services

- Same user in different roles:  
Modelling of “use cases”
- Differences according to scientific disciplines and to work in university or industry
- Importance of local and disciplinary resp. thematic accesses

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Heterogeneous information objects

- Scenes have to be made transparent to the user
- Important are documents, but also people (in their different roles), projects, communities, institutions, providers, archives
- Consequence: Highly modularized design of scientific information systems

# The Social Framework: Informational Capitalism

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

- Answers to world economic crisis of the mid-70ies: globalization and informatization
- Intensified competition in the world market in 80ies and 90ies
- Omnipresence and new immediacy of economics
- Castells: “Informational Capitalism”  
Schiller: “Digital Capitalism”

# Globalization and Networking

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Neoliberalism, de-regulation, erosion of the national state
- Transnational enterprises
- International markets for goods, capital and labour
- Networking on all levels
- Social polarization

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Informatization

- Ubiquity of digital IuC technologies
- IuC technologies as technological basis of informational capitalism
- SOA/Web Services as a new stage of network technology adequate to globalization
- New drive towards standardization

# Informatization: New quality of information

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Development of globalized socio-technical systems to generate, communicate and process information in “real time”
- Reflexivity of information, knowledge and innovation
- Basis for new dimensions of division of labour and global networking

# New Markets and Organizations

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Market-oriented forms of organizations in business and society
- Re-engineering, specialization
- Network and virtual enterprises, horizontal organizations
- Decentralization and centralization
- Increased uncertainty and risks

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Knowledge resources

- Increasing importance of knowledge resources in organizations
- Enhanced importance of external sources of information and knowledge
- Separation information searching – information provision by specialists
- Orientation to contribution to value-creating chain (“intellectual” capital)

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Knowledge work

- Polarization into upper layer of “symbol analysts” (Reich) and majority of victims of informatization and rationalization
- Erosion of “normal” work forms
- Discontinuous working biographies
- Scientific work 30% in institutions of science, 70% in business

# Information vs. knowledge

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Information is raw material: Abstracted formalized content
- Information always positively defined, otherwise it can not be modelled technically
- Knowledge bound to subject, oriented to experience, to be interpreted and communicated, can be defined only negatively

# Knowledge beyond information

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Knowledge is critique of information, systematically includes non-knowledge
- Knowledge remains “tacit” or “implicit” or “personal”
- Close relation to acknowledgement and appreciation
- Social and political embedding: “Knowledge is power” (Bacon)

# Knowledge management

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Increasing role in business and organizations
- Between the two poles of information management and social network
- Limits: Dependence on culture of appreciation, motivation, and cooperation
- Bound to working networks and people willing to give away their knowledge

# The Past: The “Gutenberg-Galaxis”

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

- Resources and providers: Printed material, specialized scientific information centers with special databases
- Products: Book and journals, working papers, “grey” literature, personal distribution
- Libraries and archives to keep the printed sources as cultural heritage (and often protect them against users)

# The “Gutenberg-Galaxis”: Functions and problems

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

- Quality evaluation by refereeing
- System of status and career access and allocation
- Central role of science publishers
- Role of universities and learned societies in scientific publishers, ambivalent interests of scientists
- Slow and expensive publication process

# The future: Distributed digital information structures

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Today already: Distributed digital access to scientific information is basis of modern scientific work
- Heterogeneity of forms and resources of information: Not only numbers, letters, pictures, maps, but also algo-rithms and large calculation systems, simulations and results, visualization, interactive objects (“dynamic” documents)

# Distributed digital information structures: New problems

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Heterogeneity of providers: Individuals, institutes, universities, enterprises, service providers, state authorities etc.
- Heterogeneity of forms or provision: Commercial, fee-based and cost-free goods
- Heterogeneity of user access: Local/regional, theme or discipline-based or general access

# Distributed digital information structures: New qualities

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- In principle unlimited possibility to multiply and transport contents
- In principle unlimited access to informations not protected via the web
- “Private” publicity becomes possible, e.g. by homepages, links in publications, chat, newsgroups, i.e. new access to media

# Distributed digital information structures: New issues

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Culture of multitude vs. “explosion of nonsense” (Wehrsig): New constellation of private and public interests
- Situation in transition: First experiments to bring new structures and order into the growing chaos
- Digital publications by science publishers, autonomous networks of scientists (e.g. MathNet, PhysNet, SozioNet), new university publishers etc.

# Distributed digital information structures: Areas of R & D

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Creating and collecting information on user behaviour and user needs
- Improvement of local access and information and knowledge management in scientific institutions
- Building of domain-specific disciplinary portals and services
- Standardization to make possible open access

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# The current situation

- Competing, often particularized concepts
- Strong tendencies to international standards of web-based services/  
XML as universal format
- Scientific information: Domain specific tools and portals, interdisciplinary islands
- Models for self-publishing and distributed authorship
- Generally, bad and worsening financial situation on user side

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Strategic issues: The user

- Integration of the multitude of interesting resources and services for the users at their workplace
- Distributed concept: Access to as many resources and services as possible, integration via local interfaces
- Improvement of transparency of the scientific scene, variable access points (local, disciplinary, theme- or domain-specific)
- Research on scientific collaboration reality

# Strategic issues: Standardization

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

- Crucial importance of open standards
- Multiplicity of standards, often not transparent, interest dominated development
- Low level of European participation
- Close relation between research and standardization, often not seen by research funders
- Problems of long-term preservation (OAIS-standard) under-estimated
- Central role for realization of user needs most often not seen

# Strategic issues: Disciplinary services and interoperability

User needs

„Information Society“

Information and knowledge

Digital era

Distributed systems

Strategic issues

- Modelling activities for disciplinary and domain-specific needs necessary
- One of the central access points for users, concentrated efforts necessary
- Integration of pay- (publishers, provider services, databases) and non-pay contents and services crucial
- Integration of heterogeneous contents and documents (intellectually structured and raw resources) necessary

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Strategic issues: Local access

- Importance of local and regional relations
- Integration of various disciplinary worlds at universities
- Integration of different providers
- Local information and knowledge management to be made a central issue of institution's management
- Improvement of ability to work with digital media, enabling of abilities to compare and evaluate traditional and digital media

User needs

„Information  
Society“

Information  
and  
knowledge

Digital era

Distributed  
systems

Strategic  
issues

# Strategic issues: User access

- Realizing user interests by providing integrated access in the dimensions of
  - rights and authentication
  - disciplinary and thematic integration
  - the economic, pay-related side of usage
  - information support, counselling and mediation
